sketch, no data: what the compute bookkeeping lets the grid show

a

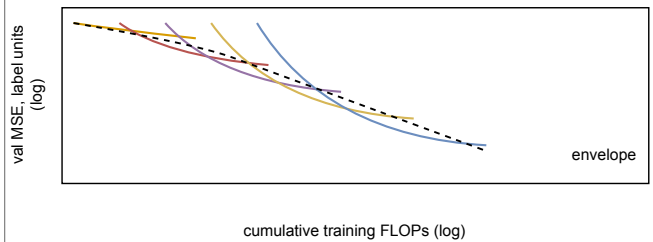

C1 Learning curves against records seen

one panel per subset in the real figure (here 1/4); sizes 45x2 to 180x8 in orange, red, purple, yellow, blue; dot = selected epoch; the vertical line is B

b

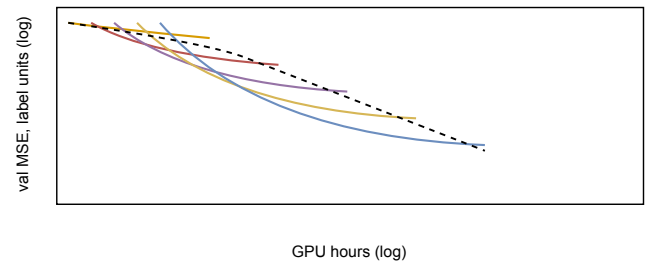

C2 Loss against training FLOPs, the envelope

trajectories by size, sizes 45x2 to 180x8 in orange, red, purple, yellow, blue; the dashed envelope is the compute-efficient frontier, one budget line of an IsoFLOP sweep

c

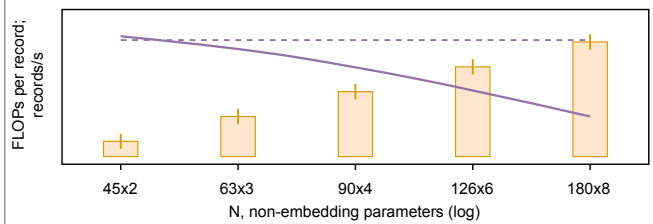

C3 Loss against GPU hours

the same envelope in queue time; the horizontal offset of a size between C2 and C3 is its utilization

d

C4 Cost per record and pace against size

bars = FLOPs per record with the min-to-max whisker over the five measured steps; purple = pace, solid if it follows the FLOPs (GPU-bound), dashed if flat (loader-bound)
