sketch, no data: the diagnostics that say how far each exponent can be trusted

a

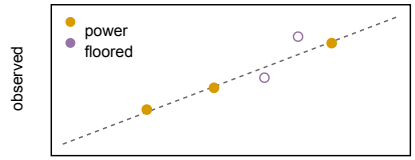

D1 Bootstrap distribution of each exponent

300 resamples; the 5 to 95% interval shaded

b

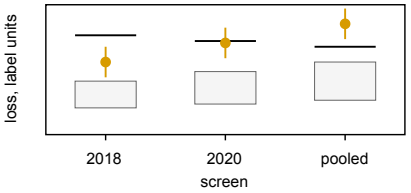

D2 Held-out prediction against observation

one marker per fit; on the diagonal = the fit extrapolated one step

c

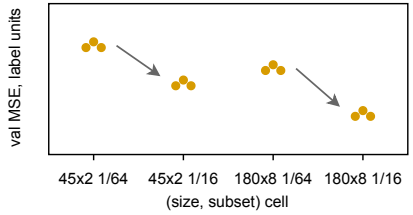

D3 Fitted E against the replicate floor

band = floor bounds; top tick = predicting the screen mean; dot = fitted E with CI90

d

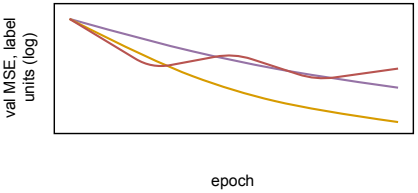

D4 Seed spread against effect size

three seeds per replicated cell; the arrow is the step to the next cell along D

e

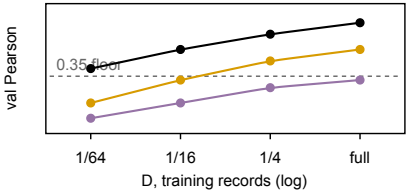

D5 The learning-rate check

45x2 on 1/4 only: lr 1e-4 purple, 2.5e-4 orange, 1e-3 red; says nothing about 180x8 at batch 256

f

D6 Per-screen Pearson beside the loss

pooled (black) carries the 0.35 screen-offset floor (dashed); 2018 orange and 2020 purple per token do not
