sketch, no data: the loss surface L(N, D) read both ways, and the fitted forms

a

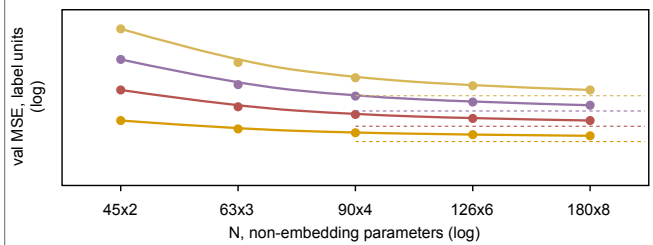

S1 Loss against D at every size

one curve per size, sizes 45x2 to 180x8 in orange, red, purple, yellow, blue; parallel curves = one beta, a fan = beta depends on N; dashed = replicate floor

b

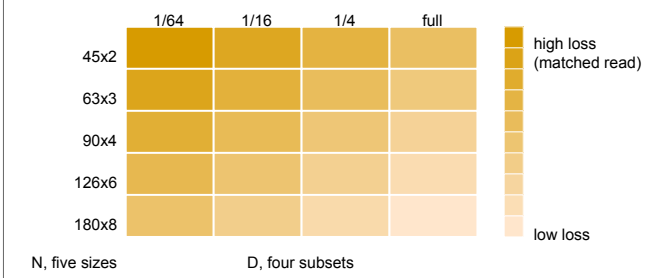

S2 Loss against N at every subset

one curve per subset, subsets 1/64 to full in orange, red, purple, yellow; each flattens at its own plateau E + B D^-beta (dashed)

c

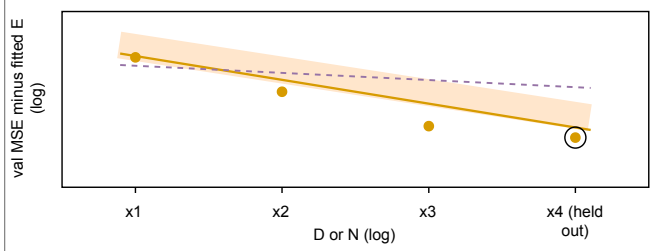

S3 The joint surface as a 5 x 4 heatmap

the steeper gradient at a cell, down a column or along a row, is where the next unit of effort goes from there; a second heatmap carries the selected read

d

S4 Fitted forms on the two axes

a straight line on L - E is the floored form holding (orange, fit on x1 to x3; band = 300 bootstraps); dashed purple = pure power law; ring = held-out point
