a measured value (the public screens, the Bioscreen wells)
learned on chemistry features (ridge, kernel ridge, nearest neighbor)
gene-mean or permutation control, and chance
a emergent and masked genes, against the pair's own similarity
emergent in the pair
masked in the pair
the control-matched null
fraction of hits
Spearman between the two single-compound profiles
b the weight on the first single, across one dose grid
methotrexate (uM)
5-fluorouracil (uM)
c profile similarity, measured where one exists
furfural
acetic acid
5-HMF
formic acid
levulinic acid
lactic acid
d profile similarity, every profile predicted
centered Spearman, one scale for both matrices
e similarity against deviation, both profile versions
measured where one exists
every profile by ridge
observed minus Bliss
profile similarity of the pair
f the GO read, and the control that explains it
the measured profile
the ridge-predicted profile
the gene mean over the fitted compounds
significant GO terms in the top hundred
