

size	combinations	grew	Loewe: called, right, missed	Bliss: called, right, false
1	6	6	6, 6, 0	6, 6, 0
2	15	12	6, 5, 7	14, 11, 3
3	20	3	0, 0, 3	16, 3, 13
4	15	0	0, 0, 0	9, 0, 9
5	6	0	0, 0, 0	2, 0, 2
6	1	0	0, 0, 0	0, 0, 0

Figure 3: Supplement one: the public benchmark in full. **a**, Every ladder arm, median centered Spearman per encoder and kernel, 62 fitted cells over 15 encoders. Fingerprint counts lead every kernel they are defined for. ✗● **b**, Each of the 32 compounds, its ridge score against its own reliability ceiling: median 0.367, 2 above the ceiling and 2 below zero. ✗● **c**, The learning curve on both targets, the uncentered one dashed. The centered curve is the one the main sheet carries. ✗● **d**, What each rule gets wrong, by combination size: how many combinations the rule called alive, how many of those were right, and what it missed or invented. Loewe misses all 3 growing triples and 7 of 12 growing pairs; Bliss calls 13 of 17 dead triples alive. ✗●
