sketch, no data: what each panel of the results figure will hold

a

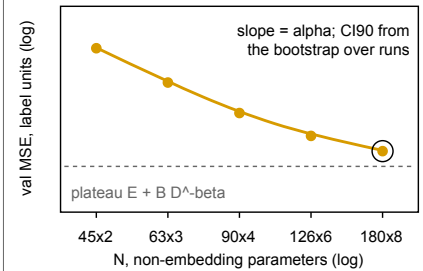

Loss against unique data at 180 x 8

030 orange, 025 purple; filled = matched read, hollow = selected read; dashed = replicate floors per screen; ring = the held-out largest point, predicted from the rest

b

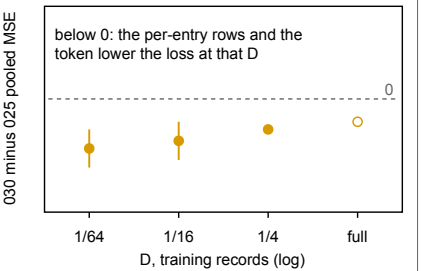

Loss against size at the full pool

five sizes, 10 epochs each: a fixed-steps slice, speed per epoch as much as capacity until the small sizes run to convergence

c

What keeping every measurement buys

seed mean and sd at 1/64 and 1/16 (3 seeds each side); the full point is two unconverged 10-epoch runs, drawn hollow
